Robots are good for society

How will robots affect society in the future in short term and long term? There is no doubt that AI will increase exponentially over time. According to motherjones.com “Artificial intelligence will be on the same level of intelligence as humans by 2060”. That will be 38 years from now. Many jobs will be obsolete and many people will be out of a job. Over the next 40 years, the question is how the economy and the state of all jobs will change. Artificial intelligence will very positively affect society in the near future.

Artificial intelligence will slowly seize over every job. Artificial intelligence right now is not very smart, but as it gets smarter it will take over more of the simpler jobs like driving. The order of jobs taken will be as follows: "routine physical: digging ditches to Routine cognitive: telephone sales to Non-Routine physical: cooks, to Non-Routine cognitive: teachers” (motherjones.com). As robots take over jobs it will take away people's ability to make money. As they are jobless they will receive a universal basic income to help them out. Over time as more and more people lose their jobs the more money the universal basic income will give. To provide a strong incentive for people who are working to keep working, the basic income will be very low. The basic income will slowly become a lot of money as AI replaces more jobs. In the end, everyone including the rich will be replaced by AI as they will be replaced.

Artificial intelligence is the most valuable asset humanity has. In the end, humans will enjoy their lives without working and have all their needs met as well as everything done for

them. They will be free to do as many fun and exciting things as they wish in the future. Robots will also advance technology. Society will have technology so advanced that they would never achieve it alone in thousands of years. At present most people are working long hours just to support themselves. They will have a better life than any king or queen in their past. As of right now, it is improving the lives of everyone. No one wants to do boring monotonous jobs, having AI replace those jobs in the future will be great. Having AI replace these types of jobs is already close to the present, “Last October, an Uber trucking subsidiary named Otto delivered Budweiser cases 2,000 120 miles from Fort Collins to Colorado Springs—without a driver at the wheel” (motherjones.com). The skills that robots learn from driving a car can be implemented in many monotonous jobs. The more skills that computers learn the better they get at learning new skills. Ultimately, robots will usher in a new era of a utopian society.

To conclude, the expansion of robots in the workforce is positive for society. Artificial intelligence will slowly replace all human jobs and everyone unemployed will get a universal basic income. Robots will ignite a worldwide new age of society where everyone will get all their needs and more. Everyone will enjoy thousands of years of technology in a matter of years and lastly, everyone will enjoy life more enjoyable than anyone in their past.
